

Final Project

David Aleman

MAT 265

05/12/2015

Concept

- I am interested in using different news outlets to display trending topics in the form of text in a 3D space that surrounds the user.
- This projects aims to show the differences in what is trending from a credible news source and what is trending from a social media site.

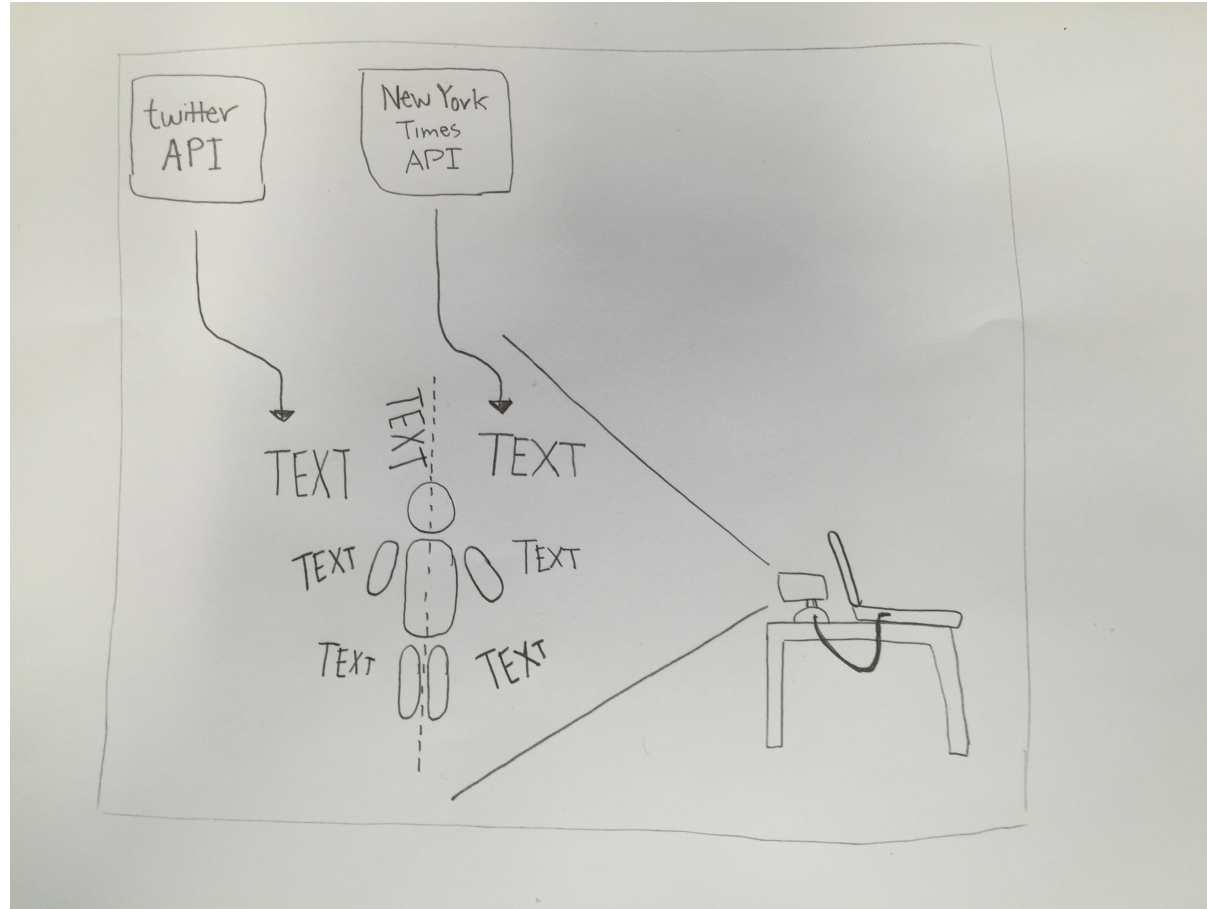

In order to achieve my goal I will be using the Twitter and New York Times API and retrieve trending stories to display in my project.

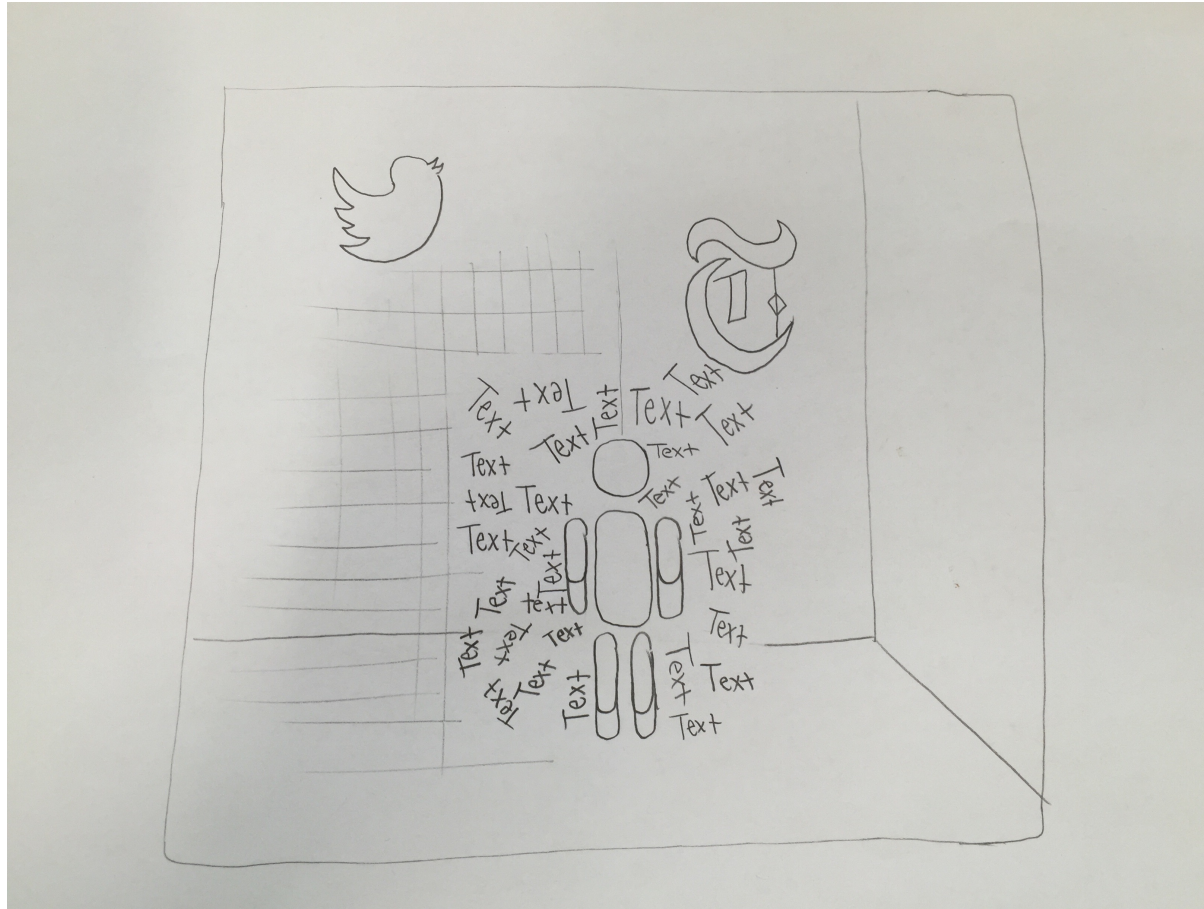

Final Project

- The trending topics will appear in the form of text and float around the user when someone gets in the ranges of the kinect camera. I aim to use the skeleton functions of the Simple OpenNI library to detect a body so the text will then surround the user.

Final Project

Final Project

- Use the text as a surface texture so the text can be displayed from twitter and new york times.
